Analysis Report

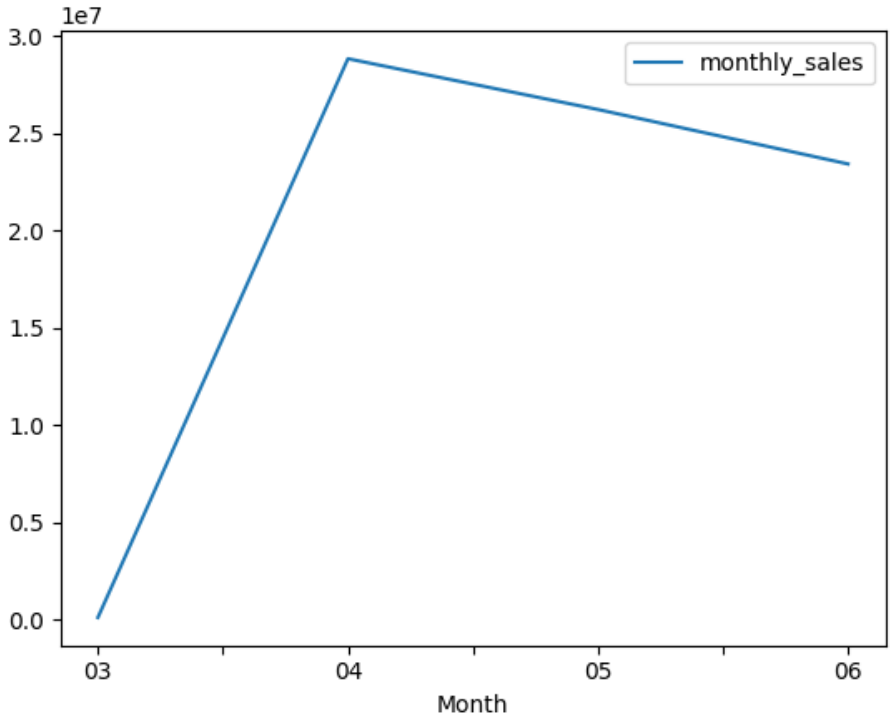
1.Sales Data:

1.1 Executive Summary:

- Total Revenue: **$ 2,580,851**
- Total Customers: **100**
- Average Order Value: **$120,000**
- Top Customer: CUST073 with sale of **$49,930**

1.2 Market Analysis:

The figure illustrates the trends for **Sales, Number of Orders, and Quantity Sold** across different months. A sharp increase is observed from March to April, indicating a **strong surge in demand and overall sales performance** during this period. April represents the **peak month**, with the highest recorded sales among all months.



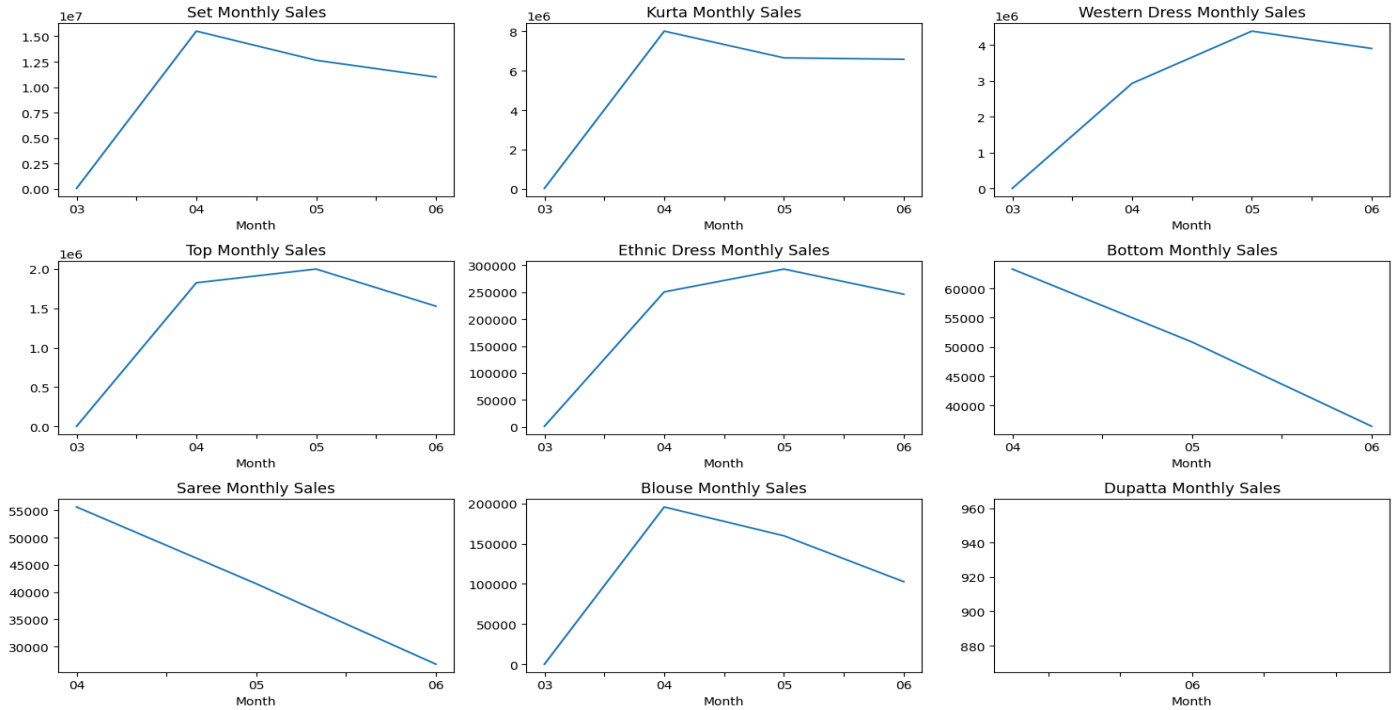
Following this peak, there is a **gradual decline in performance** from April through June. Although the decline is steady rather than abrupt, it suggests a **cooling in market activity** after the initial spike.

The overall trend highlights **high volatility in monthly performance**, indicating that sales are not consistent over time. This pattern may be influenced by **seasonal demand, promotional campaigns, or external market conditions**.

The significant rise followed by a consistent decline suggests that the April peak could have been driven by **temporary factors**, such as discounts or increased consumer demand during that period. The subsequent downward trend signals a need to **analyze underlying causes**, such as reduced demand, inventory constraints, or changes in customer behavior.

Overall, the analysis indicates that while the business experienced a **strong growth phase**, maintaining that momentum remains a challenge, and the declining trend in later months requires **further investigation and strategic intervention**.

1.3 Product Category Analysis:



A majority of categories, including **Set, Kurta, Top, and Blouse**, show a **sharp increase in sales from March to April**, indicating a strong surge in demand during this period. For most of these categories, **April emerges as a peak month**, followed by a **gradual decline in the subsequent months**, suggesting that the initial spike may have been driven by **seasonal demand or promotional activities**.

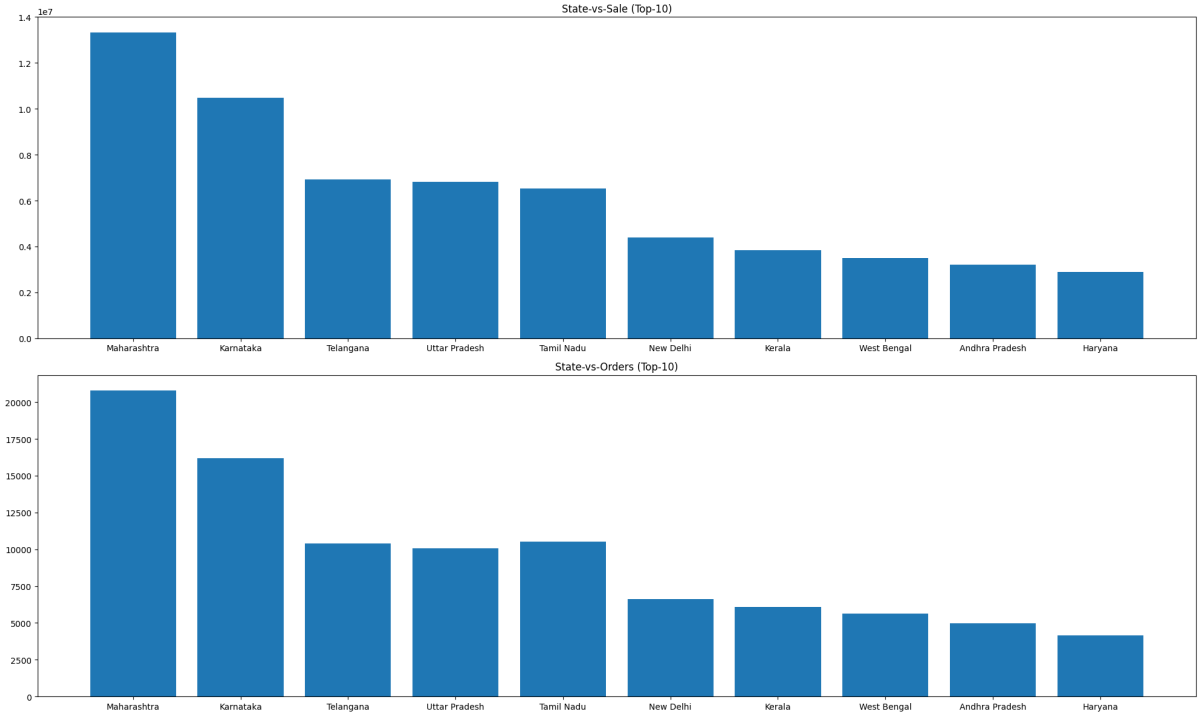
The **Western Dress** and **Ethnic Dress** categories display a slightly different pattern, where sales continue to rise into May before experiencing a **moderate decline in June**. This indicates a **delayed peak in demand**, possibly due to shifting consumer preferences or category-specific trends.

In contrast, categories such as **Bottom** and **Saree** exhibit a **consistent downward trend** over the observed period, reflecting **declining demand or reduced customer interest** in these segments. This may signal the need for **strategic intervention**, such as product repositioning or targeted promotions.

The **Dupatta** category shows minimal activity and relatively stable values, indicating **low sales volume and limited variation** compared to other categories.

Overall, the analysis reveals that while some categories experience **short-term growth followed by decline**, others show **consistent underperformance**. This variation suggests the presence of **category-specific demand patterns**, influenced by factors such as **seasonality, fashion trends, and customer preferences**. These insights can help in optimizing **inventory planning, category focus, and marketing strategies**.

1.4 State Sales Analysis:



The figure illustrates the **state-wise distribution of sales and number of orders (Top 10 states)**, highlighting significant regional variations in performance.

Maharashtra emerges as the **top-performing state**, contributing the highest **revenue as well as order volume**, indicating a strong and consistent demand in this region. It is followed by **Karnataka**, which also demonstrates **robust performance** across both metrics.

States such as **Telangana, Uttar Pradesh, and Tamil Nadu** form the **mid-tier group**, showing relatively similar levels of sales and order volumes. This suggests **stable demand** across these regions, though not at the scale of the top two contributors.

On the other hand, **New Delhi, Kerala, West Bengal, Andhra Pradesh, and Haryana** exhibit comparatively **lower sales and order counts**, indicating **weaker market penetration or lower demand** in these regions.

A key observation is the **positive correlation between sales and number of orders** across all states, suggesting that higher revenue is primarily driven by **higher transaction volumes rather than significantly higher order values**.

Overall, the analysis highlights a **geographically concentrated revenue structure**, where a few states contribute a substantial portion of total sales. This indicates an opportunity to **strengthen presence in underperforming regions** while continuing to **leverage high-performing markets** for sustained growth.

2. Cancelled Orders Data:

- **Percentage of Orders Cancelled for this period:** 14.21%
